

Abstract

Overall scientific questions.

Introduction

- Overview of the ISM. How dust forms, why we use CO as a tracer. Why we might use other tracers.
- Jeans collapse a model for star formation.
- IMF / CMF. How the high mass end changes. SF across different environments.
- Quasistatic turbulent core fragmentation as a model for star formation.
- Differences in methods.
- Literature on decoupling cores from clumps. We want to know at what stage the gas decouples.
- CHIMPS paper and other extragalactic attempts at this sort of work.

The interstellar medium (ISM) is made up of primarily gas, as well as dust and cosmic rays. It consists of 5 main phases, one of which will be discussed here. The cold ~~molecular medium (CMM)~~, neutral medium

Project Work

- Motivations (link back to the lit review).
- Methods.
- Conclusions and what that might mean.
- Future work.
